Who we are?

More than 20 years experience, leader in the field of concrete production, design and construction **ALSTONE GROUP** starts for the first time in Kosovo with the production precast concrete elements. Building with precast elements has numerous benefits, starting with the higher quality through production in the controlled environment of a precast plant, through to the time saved at the construction site. Connection technology also plays a fundamental role. Whether in transport or during installation of the precast concrete elements safety and reliability are paramount. Just as important as reliable connections is the reinforcement technology in the precast concrete elements. We **ALSTONE GROUP** know the extent of our responsibility in the reinforcement and connection technology industry. We are aware that quality and performance are decisive. This not only involves the construction project itself. It is also about ensuring the safety of all concerned on the construction site, and the subsequent occupants and visitors to the building. We incorporate all the acquired knowledge into the further development of our products.
